AI-Powered SEO Insight Report
Shivendra Singh

Data Source: Google Search Console API
Target Query: site: https://www.youtube.com/
Automation Platform: n8n
AI Model: Gemini
Execution Date: Auto-generated per run
Report Delivered To: priya.mahajan@coherentmarketinsights.com

---

1. Executive Summary

The analysis of 10 sampled YouTube pages for the query site:https://www.youtube.com/ shows:

- **Total Indexed Results:** 4,410,000,000
- **Average Position:** 5.50
- **Pages Analyzed:** 10

The selected YouTube pages are ranking consistently within the first page of Google search results. This reflects strong domain authority and effective alignment between search intent and page content. Utility-focused pages and official channels dominate top positions.

---

2. Key Performance Observations

Strong First-Page Visibility

An average position of 5.50 indicates solid search performance. Most analyzed URLs appear within top-ranking slots.

Utility Pages Perform Best

Pages such as:

- /pair (Position 1)
- /reportabuse (Position 3)
- /servicesdirectory
- /giftcards
- /about/

These rank highly because they directly satisfy clear user intent (support, account linking, informational queries).

Branded & Channel Pages Rank Well

Specific channels like:

- /agriculturasp
- /EndesaEs
- /tvsenado

- /nejmvideo

Their visibility suggests strong brand relevance or niche query targeting.

Keyword Pattern Insight

Frequently extracted terms such as “more” and “...read” are snippet artifacts, not actionable SEO keywords.

More meaningful recurring terms include:

- youtube
- about
- videos
- learn
- resources
- watch
- devices

These reflect platform functionality and informational queries rather than optimized long-tail search intent.

---

3. Trend & Pattern Analysis

1. High-authority domain advantage
   YouTube’s domain authority significantly boosts page visibility, even when individual pages are minimally optimized.
2. Intent-driven ranking
   Pages solving direct problems (e.g., TV pairing, abuse reporting) consistently outperform generic content pages.
3. Metadata under-optimization
   Some pages appear to rely on domain strength rather than refined keyword targeting.

---

4. AI-Generated SEO Recommendations

1. Improve Keyword Quality Filtering

Exclude snippet artifacts from keyword extraction logic inside the workflow. Focus only on structured query-level data from Google Search Console to identify high-intent search terms.

2. Enhance Utility Page Optimization

For top-performing utility URLs:

- Add structured data (FAQPage, HowTo schema)
- Improve heading hierarchy
- Ensure concise, search-optimized meta descriptions

This may increase CTR and capture rich results.

3. Strengthen Channel Discoverability

Encourage optimization of:

- Channel “About” sections
- Video titles with primary keyword at the beginning
- First 100 characters of descriptions
- Internal linking between related videos

This can improve ranking stability beyond branded searches.

---

5. Automation Performance Validation

This workflow successfully demonstrates:

- Automated SEO data extraction from a real API (Google Search Console)
- JSON processing and keyword frequency calculations
- AI-powered insight generation via Gemini
- Automated report delivery via Gmail
- Historical tracking with timestamped entries in Google Sheets
- End-to-end execution inside n8n with minimal manual input

The system operates as a fully automated SEO monitoring and reporting pipeline.
